Meaning of different color circuit boards in XRX?
Posted by swperk - 2010/10/31 18:55

There is a circuit board underneath an access door on the bottom of the XRX that can be one of three possible colors (yellow, green, or blue). What is the significance of the different color boards (possibly the firmware revision level)?

Thanks!

I guess they indicate the revision level of the firmware.:unsure:

It would be more accurate to say that the different color of the main board indicates its revision. The original release of the XRX was green, several years later we had a revision and a yellow board then another change and a blue, which is the current unit in production. Though occasionally we do sell the older boards in refurbished units, these are always clearly marked as refurbished.

What is the purpose behind the revision of different color circuit boards in XRX?

Circuit board manufacturers often use the color to quickly differentiate between revisions, so there is little to no confusion about which board they are working on.

I suppose it is because of the level of firmware.. high-level firmware (or software) typically is stored as a configuration of charges, low-level firmware may instead often be regarded as actual hardware...

Different colors of the circuit boards are used specify different connection. Its also makes the maintenance more easy. Because you can easily identify a specific connection.

square plastic tube | phillips head screws
